AUTUMN 1916

SPRING 1917

### ANNOUNCEMENT

Messrs. Thomas Meehan & Sons have discontinued the Seed Business and as I have had entire charge of this department for them for several years, I am now taking up and shall continue in my own behalf this business in the future. I am doing so with their good will and best wishes.

The same collectors and collecting fields as served the interests of Messrs. Meehan & Sons in the past will be with me in the future. The same honorable policies of my past employers will be continued and any changes necessary for the improvement of the service will be put under way.

With my knowledge and experience of the business,—and with the efficient corps of experienced collectors at my service, I am confident of my ability to serve you with Seeds to your entire satisfaction and advantage.

I hope I may in my own behalf be again favored with orders such as I have taken care of for you while in charge of this work with Messrs. Meehan & Sons.

## Conditions and Terms

All offers and acceptances of orders are subject to my receiving the full quantity for which I have placed orders with my growers and collectors. Failing to get these amounts, I reserve the right to reduce proportionately all orders that have been booked; or fill orders in rotation received while supply lasts.

I give no warranty, express or implied, as to description, quality, productiveness, or any other matter of any seeds, bulbs or plants I send out, and will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms they are at once to be returned.

All claims must be made upon receipt of goods.

After goods are placed on board cars here, I assume no responsibility for their safe delivery or any injury caused by delay in delivery by the transportation company.

Sacks and box and packing charged additionally.

Not less than one-quarter pound will be supplied at pound rates nor one-quarter bushel at bushel rates. Half ounces will be supplied at ounce rates where the price per ounce is not lower than 20c.

When seeds are to go by mail, postage is charged at Parcel Post rates in U. S. A. Consult your postmaster as to your zone and allow charges accordingly. Foreign countries 12c. per pound for postage.

SATISFACTORY ARRANGEMENTS FOR PAYMENT MUST ACCOMPANY ORDERS FROM UNKNOWN CORRESPONDENTS.

All P. O. orders payable at Dresher, Pa., U. S. A.

Terms—Net Cash 30 days. 2% in 10 days.

Inquiries for large lots solicited.

Cable Address "LANE AMBLER" A. B. C. Code 4th and 5th Edition.

## General Information and Suggestions For Planting

Seeds to germinate must have the proper conditions of heat and moisture. These conditions vary greatly with different seeds. Experience and close attention are necessary to successful propagation and the propagator must be a close observer of the wants and habits of trees and plants and be able to gather knowledge from what he may see. Owing to certain conditions of moisture, temperature and time which they do not always meet with after sowing, seeds sometimes fail to appear the first season. Examine them at close of Spring, and if found sound do not disturb them, and their germination may be looked for the season following.

Seeds of deciduous trees and shrubs are best sown in the Fall, pines and similar evergreens in Spring, but deciduous ones will grow very well sown in Spring if kept in good condition through the Winter. When sown in Spring seeds of a hard, bony nature, such as the yellow locust, are best soaked in hot water for a day or two and then sown at once. Seeds of maples, ash, magnolia, beech, all nut trees, as well as many other kinds require to be kept slightly moist over Winter if not sown in Fall; on the other hand, catalpa and some others may be kept quite dry until Spring comes.

All Spring sowing should be early; even if the ground freezes later it won't injure the seeds at all.

Junipers, hollies and a few similar seeds remain a full year before sprouting. It is just as well, therefore, to keep them in a box of soil until the next Autumn, then sow them.

For seed of the nut-bearing trees, as acorns, chestnut, hickory, black and white walnut, etc., the open field, if of mellow, rich soil, makes a good and sufficient seed bed.

After the ground is thoroughly cultivated, mark out as for corn, planting the seeds closely in the light furrows or drills.

The drills may be made at any convenient distance. If cultivated with the hoe they need be but a foot apart; but, unless short of room, they had better be sown in broader drills, and the drills three or four feet apart, so that the space between them may be worked with the horse or cultivator.

If the planting is done in the Fall it is better to mulch the ground with straw, leaves, or any like material; this will prevent baking of the soil after the Spring rains, and keep it in a nice mellow condition. The mulching should be removed in the Spring, or, at least so much that it will not interfere with the growth of the young seedlings.

The smaller seeds, such as maple, white ash, tulip, linden, magnolia, etc., require greater care in planting.

Let the soil be thoroughly pulverized, then throw up into beds a few feet wide, and any desirable length. Mark out and plant in drills by placing a board across the bed and making the drill along the edge of the board with a sharpened stick, then sow the seed in the drill; cover lightly, and then turn forward the board for a new drill. The width of the board regulates the distance apart of the drills, and as such seedlings are not usually allowed to grow more than one year before transplanting, the board need not be more than eight or ten inches wide. Mulch with straw if planted in the Fall, removing in the Spring.

Red and Silver Maple, Elm, etc., ripen their seed late in the Spring, or early Summer. They will keep but a few weeks, and should be planted immediately. Silver maple seed planted in June will often make a growth of fifteen or twenty inches by the last of October. Birch seed can be kept in sand in a cool place and planted the following Spring.

The seed of evergreens is always found in cones, with the exception of the juniper and yew, which produce small berries; hence, the general name applied to evergreens of coniferae, or cone-bearing.

The soil most suitable for raising conifers is a light sandy loam, rich in vegetable matter, but entirely free from rank manures. The soil should be deeply spaded and thoroughly pulverized. Then lay off in beds four feet wide, and any desirable length, with paths of one foot between. The beds should be higher in the middle, the sides being but little higher than the paths. The seed is usually sown broadcast and then carefully and lightly raked in; but some prefer sowing in drills a few inches apart, then rolling, or pressing with back of the spade, and sifting over them a very light covering of one-eighth to one-quarter of an inch of soil. The ground should be prepared the Fall before, and the seed put in at the earliest possible moment in the Spring. Most failures in growing evergreen seedlings arise from not having the seed beds partially shaded. If hot sunshine falls on them while the seeds are swelling, and cold follows, a large proportion will rot before they appear above the ground. When seedlings are raised extensively artificial arbors are made high enough to work under. When the growing is done on a less extensive scale, stakes are driven at convenient distances along the sides of the beds to which boards six inches wide are nailed, to support screens for shading the young seedlings. The lower edge of these boards should be but four or five inches above the surface of the ground, to allow the air to circulate freely over the beds. Lath screens are very satisfactory.

The germination of evergreen seeds often requires from thirty to sixty days, they being slower in swelling and bursting their coats than many other seeds. Sometimes they will lay dormant one season and come up nicely the next; hence if they fail to grow the first year it is well to examine the seed, and, if it remains plump, with fresh-looking kernels, keep the beds weeded for the next season.

The critical period for the young evergreen seedlings extends over six or eight weeks from the time they make their first appearance, or, until they form their secondary leaves. They are extremely sensitive to external influences, a little excess of drought, heat, or moisture proving ruinous, rotting the stem off at the surface of the ground.

Rainy, hot weather, or a warm rain saturating the beds after they have become very dry, will often cause them to damp off by thousands. The destruction may often be arrested by sifting dry sand over the bed.

In the Fall the young seedlings should be covered with leaves, straw, or marsh-hay, which will prevent them from being drawn out by the frequent thawing and freezing.

Approximate number of seeds to the pound; following varieties:

Abies Concolor	7,000	Berberis Thunbergii	
Abies Douglassi	25,000	Berries	4,500
Abies Excelsa	25,000	Betula alba	60,000
Cupressus Lawsoniana	40,000	Calycanthus floridus	2,400
Juniperus Virginiana	15,000	Catalpa Speciosa	12,000
Pinus Austriaca	20,000	Juglans Nigra	15 to 20
Pinus Ponderosa	12,000	Larix Europaea	12,000
Pinus Rigida	32,000	Liquidambar Styraciflua	16,000
Pinus Strobus	20,000	Liriodendron tulipifera	10,000
Pinus Sylvestris	30,000	Maclura durantica	12,000
Thuja gigantea	60,000	Magnolia acuminata	21,000
Thuja Orientalis	17,000	Morus alba	33,000
Acer Dasycarpum	2,400	Robinia Pseudo-acacia	15,000
Acer platanoides	3,000	Tilia Americana	3,500
Acer Rubrum	12,000	Ulmus Americana	45,000
Acer saccharinum	3,500	Viburnum acerifolium	7,000
Berberis Vulgaris	12,000	Viburnum prunifolium	1,500
Berberis Thunbergii,		Ampelopsis Veitchii	8,000
Clean Seed	18,000		

One of my customers reported an estimated stand of 100,000 Apple stocks from 1 bu. seed.
